“Regulatory RNAs” was the theme of the 71st annual Cold Spring Harbor Symposium on Quantitative Biology, where scientists from around the world presented the latest advances in the biology of RNAs, including RNA interference, transcriptional and translational control, RNA editing, and the role of RNAs in biological circuits and epigenetic events. Investigators discussed the latest technologies aimed at large-scale characterization of RNAs, as well as the roles of small RNAs in development and cancer. This volume is a timely survey of this important new area of molecular biology.
Now you can see results of the finest methods in action with new online movies in *CSH Protocols*.

The November issue of *CSH Protocols* features methods for tracking RNA and protein molecules in both cells and organisms, and introduces new multimedia content made possible by online presentation: movies showing examples of these techniques in action.

Read—and see—these newly featured protocols online at www.cshprotocols.org:

- Photoactivation-Based Labeling and In Vivo Tracking of RNA Molecules in the Nucleus
- Selection of Appropriate Imaging Equipment and Methodology for Live Cell Imaging in *Drosophila*

*CSH Protocols* offers cutting edge and classic protocols in molecular and cell biology from laboratories worldwide, along with methods from Cold Spring Harbor Laboratory’s renowned manuals and on-site courses. Free trials and discounted subscriptions are available for a limited time.

*CSH Protocols* is created by Cold Spring Harbor Laboratory Press in association with HighWire Press of Stanford University.

GIPZ: Greater Specificity and Visibility than siRNA - Guaranteed!

Targeting the entire human and mouse genomes, the GIPZ Lentiviral shRNAmir libraries are the most powerful tool available for RNAi.

- **Specificity** - shRNAmir design produces highly specific RNAi
- **Visible Validation** - Turbo GFP marks shRNAmir expressing cells
- **Versatility** - Perform in vitro and in vivo RNAi
- **Discovery Potential** - Targets both annotated and unknown genes
- **Lentiviral Delivery** - RNAi is now possible in primary and non-dividing cells

**Why experiment when you can discover?**

“We find that Open Biosystems’ GIPZ shRNAmir offers three fundamental advantages over competing reagents: the flexibility to transfec or transduce the shRNA constructs, the ability to select shRNAmir expressing cells using antibiotic resistance or sorting by GFP fluorescence, and finally, the vast majority of the shRNAmir constructs yield >75% reduction in target protein expression. I believe that the mir-adapted design and the bioinformatic algorithms lead to improved silencing.”

- Aleister J. Saunders, Ph.D.
  Director - Drexel University RNAi Resource Center

Data produced in vitro shows that with equivalent TPS3 knockdown, the off-target signature with shRNA is much smaller than with siRNA.
