La Jolla, California. After years of research, Stratagene has just released the most advanced DNA sequencing system available. The system’s prepoured, polyacrylamide gels eliminate the need to manually pour sequencing gels.

Until now there was no alternative to pouring your own sequencing gels. It took up to 2 hours of preparation to clean the plates, mix the solutions, de-gas the acrylamide, pour the gels and wait for polymerization. Stratagene’s scientists have changed all that with the new CastAway™ sequencing system.

Stratagene’s new sequencing system cuts both electrophoresis and gel drying times in half, so researchers using the system have found they have more time available to meet their research goals. The system components have been designed to be used together. The system includes a novel vertical sequencing device and high-speed gel dryer designed to produce superior results when used with the quality-tested precast gels.

**Precast Sequencing Gels Are Here**

*Superior Results in Less Time*

CastAway precast gels are ready to load in less than 5 minutes with no mess. While conventional procedures can take up to 6.5 hours to sequence a gel, the CastAway system takes as little as 2 hours. The procedure is simple: open the bag, place the gel in the sequencing device, run the gel and dry.

The precast sequencing gels are thinner than standard gels, so they can be run at higher temperatures. This not only shortens run times, but also reduces the possibility of band compressions. Since the CastAway gels are bound permanently to one of the glass plates, there’s no need for filter paper and less risk of gel tearing. And two prepoured gels fit perfectly into a standard x-ray cassette.

**Vacuum Pumps Have Become Obsolete**

*New High-Speed Gel Dryer Takes Over*

Not only do the precast gels save run time, but the CastAway gel dryer works twice as fast as any commercially available gel dryer. The gel dryer is easy to load; the gel dryer slide right in.

Researchers who currently use vacuum pumps to dry their gels will immediately notice the quiet operation of the gel dryer. Not only are vacuum pumps loud and distracting, but they are expensive to purchase and maintain. In contrast, the CastAway gel dryer is quiet, cost-effective and requires no maintenance. The new gel dryer works with the CastAway system to bring the future of sequencing into your lab.

**Easy Loading Sequencing Device**

*Simple and Safe*

Stratagene engineers have developed a vertical sequencing device that is simple and safe to operate. The new CastAway vertical sequencing device is exclusively for use with CastAway precast gels and is optimized to provide high quality results. The CastAway sequencing device features a new easy-to-use gasket; the CastAway precast gels snap in and are ready to run. An advanced thermoplate evenly diffuses the heat during electrophoresis, ensuring less artifacts and crisper bands. The CastAway sequencing device works twice as fast as conventional vertical sequencing devices to save even more valuable research time.

The CastAway system also includes convenient, stackable fixing trays for soaking gels after removal from the sequencing device, and a radiation storage container to store radioactive gels until safe for disposal.

---

**CastAway Sequencing System**

- Sequencing device
- Gel dryer
- Radiation storage container
- 2 fixing trays
- High voltage leads
- 9 shark-tooth combs
- Gasket lubricant

**CastAway Sequencing Device**

- Sequencing device
- High voltage leads
- 9 shark-tooth combs
- Gasket lubricant

**CastAway Gel Dryer**

- Gel dryer
- Power cord

**CastAway Precast Sequencing Gels**

- 5 prepoured 6% polyacrylamide gels (0.25 mm)

**CastAway Fixing Trays**

- 401098 401099

**CastAway Radiation Storage Container**

- 401070

GENOME RESEARCH
Reader Survey Giveaway

Just take a few minutes to fill out this Reader Survey and we’ll enter you in a drawing to win a free airline ticket good anywhere in the continental United States!*

Please FAX completed forms to 516-367-8532. Or, mail to: Genome Research, Cold Spring Harbor Laboratory, 1 Bungtown Road, Cold Spring Harbor, NY 11724.

Employees of Cold Spring Harbor Laboratory and members of their immediate family (spouses, children, and parents) are not eligible. Limit one entry per person. All sections must be completed to be eligible.

Product News....

Product News features newly available equipment, laboratory materials, and software that may be of interest to the readers of this journal. Endorsement by Genome Research or Cold Spring Harbor Laboratory is not implied. Readers may obtain further information regarding these products by entering the appropriate numbers on the postage-free Reader Service Card included in this issue.

Row and Column Pools Now Available for Human BAC Library

The row and column pools for the Human BAC library are now included with the DNA pools. These row and column pools add twenty-four 96-well plates to the existing set of DNA pool plates. The screening of the superpools will total 48 reactions, and the screening of the plate, row, and column pools will total another 48 reactions. After only 96 total reactions, the researcher will have a complete clone address.

For additional information, call Research Genetics, Inc., at (800) 533-4363. Reader service number 226.

Human PAC (P1 Artificial Chromosome) Custom Library Screening Service by Hybridization or PCR

BIOS Laboratories introduces a Human PAC Library Screening Service that utilizes the Roswell Park Cancer Institute (RPCI) Library. For hybridization screening, customers supply BIOS with a DNA fragment, and, for PCR screening, customers supply a primer set. The RPCI-1 Human PAC Library/Service offers several advantages: 3 × human genome coverage; an average insert size of ~150 kb; genomic DNA that is exempt from recombination and rearrangement artifacts. Upon service completion, BIOS provides positive clones and confirmation data. PAC clones may be used for FISH analysis, contig assembly, promoter analysis, or sequencing. See our home page, at http://www.bioslabs.com.

For additional information, call BIOS Laboratories at 1(800) 678-9487 or fax at (203) 562-9377. Reader service number 227.

Antibodies to Cell Cycle Proteins

Rockland Immunochemicals is producing a series of antibodies designed to facilitate the study of eukaryotic cell cycle mechanisms. The identification of the cellular proteins involved in the control of cell proliferation in normal cells is essential for understanding the mechanisms underlying growth regulation and cellular transformation. Highly purified synthetic peptides and/or fusion proteins were used to generate highly specific antibodies to cyclins, as well as cyclin-dependent kinases, kinase inhibitors, and tumor suppression proteins. Each reagent has been thoroughly tested for use in Western blotting, immunohistochemistry, ELISA, and immunoprecipitation.

For additional information, contact Rockland, Inc., P.O. Box 316, Gilbertsville, PA 19525; (800) 656-ROCK, fax (610) 367-7825. Reader service number 228.
Instructions to authors

**GENOME RESEARCH** welcomes high-quality research papers reporting new data in physical and genetic mapping, DNA sequencing, gene discovery, informatics, statistical and mathematical methods, DNA-based technology development, gene function, genome structure and function, and human disease. The journal also publishes review articles, short reports, and summaries of physical mapping and large-scale sequencing projects. All submissions to the journal will be peer-reviewed.

Publication time from acceptance of manuscript is within two months. For papers accepted subject to revision, only one revised version will be considered; it must be submitted within two months of the provisional acceptance.

The journal accepts papers that present original research that has not previously been published. Submission to the journal implies that a paper is not currently being considered for another journal or book. It is also understood that researchers who submit papers to this journal are prepared to make available to researchers materials needed to duplicate their work. Authors of accepted manuscripts must submit mapping and sequence data to the appropriate data bank and provide an accession number for this data at the page proof stage.

Papers should be submitted to:

Judy Cuddihy, Managing Editor  
Genome Research  
Cold Spring Harbor Laboratory Press  
One Bungtown Road  
Cold Spring Harbor, NY 11724  
e-mail: cuddihyj@cshl.org

**Manuscript preparation**

Five copies of the manuscript should be submitted; at least four of these copies should have original art. A cover letter should include: (a) name, address, telephone number, FAX number, and e-mail address of author responsible for correspondence regarding the manuscript; (b) statement that the manuscript has been seen and approved by all listed authors; (c) any specific requirements for reproduction of art; (d) status of any statements of personal communication or other permissions needed; and (e) statement regarding databank submission of data.

The following order of manuscript sections is preferred: title page, abstract, introduction, results, discussion, methods, acknowledgments, references, tables, figure legends. Computer printouts of the manuscript should be of letter quality, and each page should be labeled with the first author's name and a page number. The methods presented should be detailed enough to allow any qualified researcher to duplicate the results.

Figures should be supplied as high-quality, glossy prints. All figures should be labeled with the first author's name, the figure number, and an indication of the top of the figure. The size of the figures will be adjusted to fit the journal format; therefore, please try to keep labels, symbols, and other call-out-devices in proportion to the figure size and detail. Authors wishing to publish four-color art must pay the associated publication costs; price estimates will be provided on acceptance of the paper.

**Accepted manuscripts**

Paper length in the journal is between 2 and 12 journal pages. A manuscript of 28–32 typed, double-spaced pages with 27 lines of 11 point text per page (a manuscript of 63,000 characters) with 4–6 figures and 1 or 2 tables will translate to 12 printed pages in the journal.

Accepted manuscripts should be supplied in a printed-out manuscript and on a disc to expedite typesetting. Please supply the manuscript as an ASCII text file if possible. If a word-processing file is being sent, please do not include any underscoring, italic, or boldface; spell out special characters (Greek, math); use two carriage returns at the end of each paragraph, subheads, and list items. Indicate on the disc: computer brand name, type of file (text or word-processing), name of software, and disc format. Accepted manuscripts can be e-mailed to cuddihyj@cshl.org, but a confirming printout of the paper should be sent to the journal offices.

Proofs are considered the final form of the paper and corrections can be made only in the case of factual errors. If additional information must be added at this stage, it should be in the form of “Note added in proof,” subject to the approval of the Editors.

To help defray the cost of publication, a charge of $20 per page will be made for publication in *Genome Research*. Authors unable to meet these charges should include a letter of explanation upon acceptance for publication; inability to meet these charges will have no effect on acceptance and publication of submitted papers.
