Supplementary Figure S2. Profile of TAL1 binding on gene loci coding for transcription factors with functions in erythropoiesis
For each locus are shown (from top to bottom): the RefSeq annotation of the gene or part of the gene (in orange, exons; thin lines, introns; arrow, position of the TSS); ChIP-SEQ profiles in $Tal1^{WT/WT}$ (black tracks) and $Tal1^{RER/RER}$ (red tracks) cells. Stars indicate peaks that are present specifically in erythroid cells in loci also bound by Tal1 in early haematopoietic cells (Wilson et al. 2009. *Blood* 113: 5456-5465).
