

Supplemental Figure S2 Solid-phase reverse transfection of anti-KIF11 antibody in HeLa cells. Transfection condition VIII using Lipofectamine®RNAiMAX (Supplemental Table S1) was used. The transfection was performed in 384-well plates. Cells were trypsinized 2 hours post transfection, seeded to a mock-coated 384-well plate and fixed after another 4 hours of incubation. Nuclei were counterstained with Hoechst 33342 dye. Scale bar: 20 μ m.
