

**Supplementary\_Fig\_S2.** *VEGFA* and *BRD4* loci are accompanied by hydroxymethylation in pancreatic cancer: Distribution of 5-hydroxymethylated peaks in non neoplastic controls, pancreatic cancer cell lines and patient derived xenografts shows acquisition of 5-hmC peaks in (A) *VEGFA* gene body and (B) *BRD4* promoter with strong overlap with H3K4me1 peaks in most neoplastic samples. No 5-hmC peaks seen in controls (HDPE, HPNE).
