Supplemental Figure S3. mCherry expression is not affected by the cloned oligo sequence. (A-B) Violin plots of flow cytometry measurements of eGFP (A) and mCherry (B) across the 16 expression bins on the day of sorting. EV= empty vector. (C) Flow cytometry measurements of eGFP and mCherry expression of the isolated clones. Each isolated clone expresses a single designed oligo from the library. No correlation is obtained between eGFP and mCherry expression ($p > 0.1$, Pearson correlation).
