

**Supplemental Figure S4:** Consensus 5' and 3' splice site sequences for all differentially spliced events in the individual snRNA knockdown versus control samples (MCF-7). Nucleotide heights correspond to their frequency across the differentially spliced events (N). Motifs are derived from the DNA gene sequence, using T instead of U. Grey boxes (*bottom*) indicates the location of the upstream and downstream exons, with the intervening intron truncated at the double slashes.
