Genes up-regulated in breast cancer tumors (formed by MCF-7 xenografts) resistant to tamoxifen [PubChem=5378].	1	3.80E-08	0.000127727	3.172812	29	0.1676301
Genes up-regulated in MEF cells (embryonic fibroblast) upon stimulation with TGFβ1 [GeneID=7040] for 1 h.	2	5.40E-08	0.07534E-05	12.72796	9	0.05202312
Genes up-regulated in NB27 cells (osteosarcoma) at any time point after inducing the expression of a mutant form of WT1 [GeneID=7490].	3	4.68E-07	0.00524379	4.141624	18	0.1040462
Genes up-regulated in NHEK cells (normal epidermal keratinocytes) after UVB irradiation.	4	2.70937E-06	0.002278576	3.840704	17	0.0982659
Genes down-regulated in MDA-MB-231 cells (breast cancer, mutated TP53 [GeneID=7157]) undergoing mitotic arrest and apoptosis after treatment with 100 nM docetaxel [PubChem=148124].	5	3.17155E-06	0.002133818	23.04598	5	0.02890173
Genes down-regulated in UB27 cells (osteosarcoma) at 12 hr after inducing the expression of a mutated form of WT1 [GeneID=7490].	6	6.01423E-06	0.003371977	4.035268	15	0.0867052
Genes up-regulated in cells that have been partially reprogrammed to pluripotency: comparison with the parental lineage-committed cell lines, fully reprogrammed stem cells, and embryonic stem cells.	7	6.35962E-06	0.003056252	19.94349	5	0.02890173
Genes up-regulated in anaplastic thyroid carcinoma (ATC) compared to normal thyroid tissue.	8	7.89894E-06	0.003321506	2.602991	26	0.150289
Cluster d1: genes down-regulated in WS1 cells (fibroblast) at 6 h after irradiation with high dose UV-C.	9	9.13451E-06	0.003414276	18.49156	5	0.02890173
Genes with high-CpG-density promoters (HCP) bearing histone H3 K27 trimethylation mark (H327me3) in embryonic stem cells (ES).	10	1.53275E-05	0.005156178	7.428409	8	0.04624277
Genes down-regulated upon overexpression of PARVB [GeneID=29780] in MDA-MB-231 cells (breast cancer) cultured in 3D collagen I and 3D Matrigel only.	11	1.69752E-05	0.005191313	2.952564	20	0.1156069
Genes down-regulated in OV-90 cells (ovarian cancer) exposed to ascites which inhibited invasion.	12	2.19542E-05	0.006154491	4.830684	11	0.06356382
Genes down-regulated in PC3 cells (prostate cancer) after knockdown of NIP1 [GeneID=5511] by RNAi.	13	3.163E-05	0.008184866	2.349791	27	0.1560694
Genes down-regulated in HEP3B cells (liver cancer) overexpressing ATF5 [GeneID=22809] off a plasmid vector.	14	4.25938E-05	0.010234691	21.38197	4	0.02312139
Cluster 3: ECM related genes up-regulated in dermal fibroblasts within 30 min after TGFβ1 [GeneID=7040] addition; returned rapidly to basal level after that.	15	4.67518E-05	0.010484879	20.87125	4	0.02312139
Genes down-regulated in glomeruli of kidneys from patients with diabetic nephropathy (type 2 diabetes mellitus).	16	4.95012E-05	0.010407629	2.575037	22	0.1271676
Top 30 increased eosinophil specific transcripts.	17	4.97447E-05	0.009843596	12.83122	5	0.02890173
Genes whose expression peaked at 60 min after stimulation of HeLa cells with EGF [GeneID=1950].	18	5.96427E-05	0.011146556	7.280776	7	0.04046243
The 'adult tissue stem' module: genes coordinately up-regulated in a compendium of adult tissue stem cells.	19	6.47931E-05	0.011471794	2.099668	31	0.1791908
Set 'Sox2 targets': genes upregulated and identified by ChIP on chip as SOX2 [GeneID=6657] transcription factor targets in human embryonic stem cells.	20	6.76395E-05	0.011376964	2.342185	25	0.1445087

This script takes a whole-genome maf alignment, a reference-based genome assembly of a species not present in the maf alignment but referenced against a species which is present, the id of the reference species. This script:

- 1) Reads through the alignment
- 2) Finds subalignments where the reference species is present
- 3) Extracts metadata from the reference (i.e. chr/scaff number, start, end, strand etc)
- 4) Uses that information to extract the equivalent region from the reference based assembly

Several assumptions are made:

- 1) The coordinate systems of the reference genome and the reference-based assembly are identical
- 2) The scaffold IDs are the same

This script contains some hard-coding (esp. regarding expectations of what input genome's scaffold ID's will look like). This can be modified for other datasets.

```
# Collect arguments  
# in_name - input maf alignment  
# out_name - output maf alignment  
# refspec - ID of the species that acted as the reference genome for the input  
#           reference-based assembly  
# refassem - filename of the reference based assembly  
# suffix - suffix for labelling  
# minimum number of species  
# prefix for labelling
```

=pod
```

Try to figure out if there is a smarter way to do my weighted averages.
 Maybe instead of giving greater weight to elements of greater length
 (as a proportion of the sum of peak lengths).

Notes before starting:

1) Both the cds and ChIP intersection (isect) files must be sorted in a specific way.
 open in Microsoft Excel/LibreOffice Calc and sort the data in ascending order by the
 following columns.

cds gff:

```
sort key 1: column 9 (gff attributes) -> unique id
sort key 2: column 6 (gff score) -> Use script to set score to exon number before intersecting
sort key 3: column 4 (gff start) -> coordinate for start of entry
```

ChIP bed

```
sort key 1: column 4 (bed ID)
sort key 2: column 2 (bed start)
```

```
=cut
```

```
# Pause for debugging
my $pause;
# Flags for gff/bed specific index numbering
my $gff_flag = 'gff';
my $bed_flag = 'bed';
```

```
# Collect arguments
my ($cds_isect, $chip_isect, $target_seg_num, $max_filled_perc) = @ARGV;
```

```
# Open isect gff files
open (CDS, $cds_isect);
open (CHIP, $chip_isect);
```

```
# Collect gff file contents. These will be used to collect initial data
# then subsequently edited with each merge cycle.
my @cds_gff = <CDS>;
my @chip_bed = <CHIP>;
```

```
#-----Collect initial stats-----#
```

```
# Get an initial (weighted) average number of segments per exon in the cds gff file
# This data will be updated progressively with each merge cycle until the target
# average is met, or the max percent of filled gaps (see below) is exceeded
my $avg_seg_num_exons = GetAverageSegNum(@cds_gff);
```

```
# Set the initial average gap filled percentage in ChIP isect elements to zero
# since nothing's been filled in yet
my $avg_filled_perc_chip = 0;
```

```
=pod
```

Make a hash that holds the lengths of each isect element. This hash will be initialize as the sum of the lengths of all isect elements (isect elements being the intersection of ChIP and conservation data) for each exon (as numbered in annotations). Each time gaps are filled in the merging algorithm, the number of gap bases filled will be added to the corresponding element in this hash. Thus, the percent gap filled for each exon will be calculated as the number of filled bases in that exon divided by the total length of the exon (original isect length plus length of filled bases). These percents will then be used to calculate a weighted average for the percent of filled bases over the total isect dataset and compared to the maximum allowed.

```
=cut
```

```
my %total_chip_lengths = GetElementLengths(@chip_bed);
```

```
# Make another hash that will hold the lengths of only the filled bases in ChIP isect elements.
# These will be the values divided by the total lengths in the total_lengths hash above
my %filled_chip_lengths;
```

```
print "Initial average segment number: $avg_seg_num_exons\n";
print "Initial average percent filled gaps: 0\n\n";
```

```
#-----Begin Merging Algorithm-----#
```

```
=pod
```

This algorithm will iteratively merge adjacent segments in the cds and gff isect datasets increasing the allowed distance between merging elements by 1 each cycle until one of two sets of conditions are met.

The first (ideal) condition is that the (weighted) average number of segments per cds exon isect is less than or equal to the average target number, and the (weighted) average percent length of ChIP isects composed of filled gaps is as close to the max percentage as possible while still being less than or equal to it.

The second (not as good) condition is that the average percent filled gaps in ChIP elements reaches the maximum before the target average segment number per exon isect has been met. This is an allowable outcome, but it may mean the user needs to adjust their expectations for either the target average number of segments per exon isect or the percent of ChIP elements that may be composed of filled gaps

After each cycle that neither of these conditionals are met, the merge distance will be increased by 1 and the results will be re-checked

```
=cut

#####
# merge_bed_annotations_by_distance3.pl
#####
```

```
#!/usr/bin/perl
```

```
=pod
```

This script will accept a bed-formatted annotation file (e.g. phastCons conserved elements intersected with ChIP elements), determine their distances from each other going from left to right, and merge elements which are less than a pre-specified number of bases apart. For example, if annotated p300/H3K27a peaks have poor overall coverage by conserved elements, but are tiled by many small, relatively closely spaced conserved elements, merging adjacent elements which are avg bases apart could improve the percent coverage of annotations by conserved elements. This may make sense in cases where the average distance is quite high but median is quite small (i.e. many small elements are closely clustered together, but clusters themselves are much farther apart).

This doesn't need to be done across the whole genome, only the intersection of ChIP and phastCons data. Thus, merging can be done between conserved regions within the bounds of a larger ChIP peak.
