Supplemental Fig. S1: Histogram of pcfCRE lengths binned by 50bp

Supplemental Fig. S2: Histogram of distances between pcfCREs and Transcription Start Sites (TSS). Genes are assigned a proximal domain of 5kb upstream from the transcription start site (TSS) and 1kb downstream. A distal region extends out from the TSS to the proximal region of the next closest gene, or up to 1mb. Based on its coordinates in the reference genome, each pcfCRE falls within 0 or more gene-regions. The distance between each pcfCRE is calculated from the edge of the element to the TSSs for each gene into whose gene-region it falls. Here, distances are binned by 20kb. Mean and median distances are absolute values as genes can be upstream (positive distance) or downstream (negative distance) from each pcfCRE.

Supplemental Fig. S3: Comparison of pairwise branch lengths between UCSC and modified tree models. Pairwise distances (branch lengths) between all branch tips in the UCSC phyloP tree model were compared to distances from equivalent pairs of nodes in the modified, 61-way tree model used in this study. The thylacine node was removed from the 61-way model and dog replaced with wolf. Branch lengths are highly consistent between the two models. Species used and branch lengths are given in Supplemental Table S23.

Supplemental Fig. S4: Boxplot showing variation in the number of accelerated regions per species across a selection of mammals. Boxes represent upper and lower quartiles. The line within each box represents the median number of accelerated regions. Circles represent counts for individual species and the X represents their mean. Upper and lower whiskers represent the maximum and minimum numbers. The blue box is the number of accelerated regions based on their raw acceleration p-value. The orange box is the number of accelerated regions after Benjamini Hochberg correction (FDR = 0.1). Species used and numbers of elements per species are given in Supplemental Table S24
