

Figure S6. Odds ratio (*OR*) of potentially functional-enriched variants (those with higher *CADD* scores) due to lower allele frequency (*AF*). The horizontal dashed line indicates *OR* of 1. With *OR* > 1, PTVs of lower *AF* are always associated with higher *CADD* scores. Variants of different functional impacts are examined. A 2x2 contingency table is constructed to calculate an *OR* for a specific type of variants with a *CADD* and *AF* value as a cutoff.
