

Expression

Supplemental Figure S12. Expression of transcription factors (TFs) associated with selected motif features in the DRMN analysis of the Seirup et al. data set (**Figure 5**). Each block of regulators (black outline) represent the sets of TFs associated with an individual regulatory motif feature selected in **Figure 5B**. LHX2 and ALX1 are examples of regulators that are not expressed, yet have related TFs (LHX9 and ALX4, respectively) which are expressed and associated with the same motif features. This suggests that regulators selected by DRMN are likely to be expressed in the cell state of interest.
