

Supplemental Fig. S5. P-M plot of variant rs28175542, a coding transcript intron variant identified in the meta-analysis of measures annotated to VT:0010722: Withdrawal Response to Addictive Substance Trait. Each dot represents a measure colored by the method used, annotated to the measure in MPD. The x-axis is the METASOFT m-value which refers to the posterior probability the effect exists in the study (Han, Eskin 2012), such that measures with m-values ≥ 0.9 are estimated to be affected by the variant. The y-axis is $-\log_{10}(p)$ where p is the measure-level GWAS p-value.
