

**A****B**

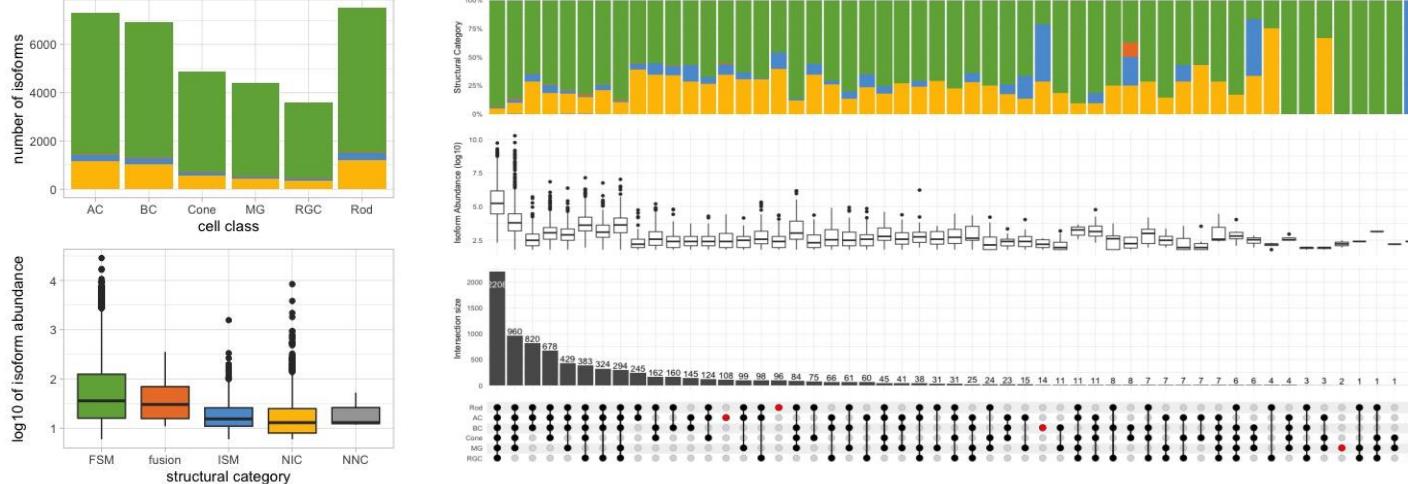

### C Using 50% of demultiplexed LRs

### D Using 10% of demultiplexed LRs

### E Using 1% of demultiplexed LRs

## **Figure. S5 Down sampling analysis**

- A. Classification of isoforms according to their splice sites when compared to reference annotations and number of isoforms in each category detected by the 100%, 50%, 10% and 1% of demultiplexed LRs.
- B. Venn diagram showing intersection of the FSMs detected using all, 50%, 10% and 1% of demultiplexed LRs. The counts were based on analysis result using software gffcompare.
- C. Number of isoforms in different categories for each cell class, isoform abundance in different categories and overlap of isoforms in cell classes for the isoform set detected using 50% of demultiplexed LRs.
- D. Number of isoforms in different categories for each cell class, isoform abundance in different categories and overlap of isoforms in cell classes for the isoform set detected using 10% of demultiplexed LRs.
- E. Number of isoforms in different categories for each cell class, isoform abundance in different categories and overlap of isoforms in cell classes for the isoform set detected using 1% of demultiplexed LRs.
