

Figure S17

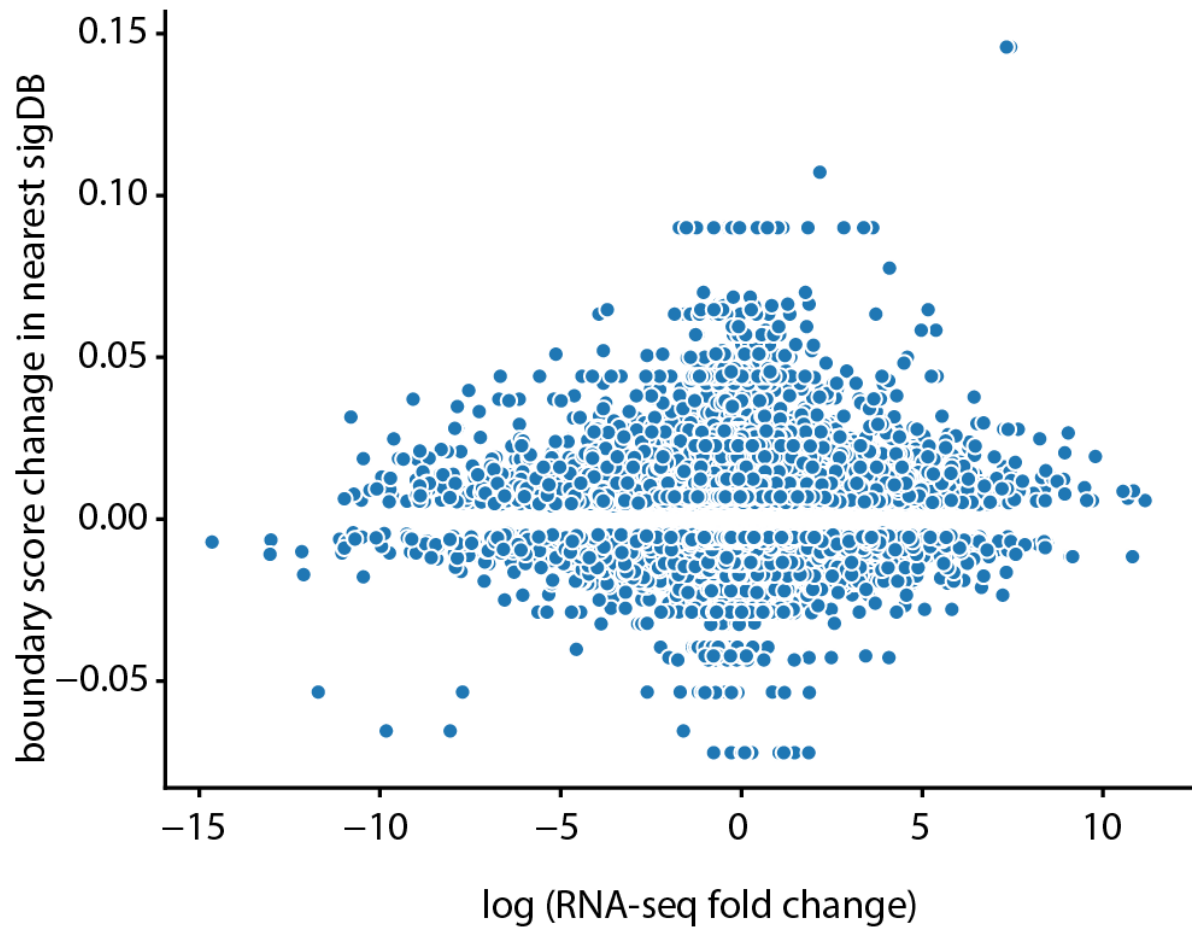

Figure S17. Change in gene expression vs boundary score change in the nearest significant differential boundary (sigDB) for the H1-endoderm differentiation dataset. For each gene, shown is the log fold change in the expression level (TPM) of a gene between H1 and endoderm (H1/endoderm) against the change in boundary score of its nearest sigDB (H1-endoderm). Overall, there is no correlation between the change in expression and change in boundary score (Pearson's $R = 0.03$).
