

Distribution of Structural Similarity vs Sequence Identity for Paralogous Pairs (LDO, MDO)

Supplemental Fig. S4. Comparison of structural and sequence similarity between paralogues. The left panel shows paralogues from the symmetric category (blue, $n=581,932$), and the right panel shows those from the asymmetric category (orange, $n=84,516$). The Pearson's correlation coefficient (PCC) between structural similarity (Foldseek LDDT) and sequence identity is indicated in each plot.
