
Supplemental Figure S9. Relationships between ~110 bp long central regions of 1577 intercalary segments in which *TfSat03* monomers change orientation. The graph network illustrates the sequence similarity relationships based on the alignment presented in Supplemental Data S2. Each dot represents a sequence, and the color of the dot indicates a *T. freemani* chromosome on which a sequence is located. The color-coded legend of the chromosomes (fLGs) is shown next to the graph. The cluster, which consists of 100% identical sequences originating from different chromosomes, is marked with a black square and shown enlarged. An interactive representation of the graph network is given in the Supplemental Data S3.
